## Assignment 3: TicTacToe

A short tutorial

## TicTacToe... The game

- I am sure you have played TicTacToe before, you have experienced it, so we know the following facts:
  - The game requires 2 players
  - The game has a game board
  - The game board starts with 9 empty blocks or cells organized in a 3 by 3 grid
  - Each player takes a symbol, usually X and O
  - The game ends either by one player winning or we fill up the board without a winning move, that would be a draw.
  - Players take turn, no player can take 2 consecutive turns.
  - A player can only move onto an empty block
  - The game is won when a player holds three consecutive blocks, either horizontally, vertically or diagonally.

## Can we design a structure and assign responsibilities to objects – who does what?

- Well we need a board, and a board has 9 blocks
- We need a game instance that manages the game play (coin toss to start, turns, declare winner, etc)
- We need 2 players in the game.

## Sample UML used in the demo

# «interface» global Constants + DEBUG: boolean + DRAW: int + EMPTY: int + 0: int + X: int

#### Object

#### TicTacToe

Constructors ~ TicTacToe( ) : void

Methods

<u>+ main( String[] ) : void</u>

#### Object

#### game

#### Fields

- ~ done : boolean
- ~ gameBoard : board
- ~ player0 : player
- ~ playerX : player
- ~ turn : int

Constructors

+ game(): void

Methods + start(): void

#### Object

#### board

Fields

+ blocks : block[][]

#### Properties

«read0nly»

+ state : int

Constructors

+ board(): void

#### Methods

- checkCol( int ): int
- checkDiagonals(): int
- checkDraw(): int
- checkRow( int ) : int
- + displayBoard(): void
- + displayPlayerSelectionBoard(): void
- + makeMove( int, int ) : boolean
- + updateState(): int

#### Object

#### block

Properties

+ state : int

Constructors

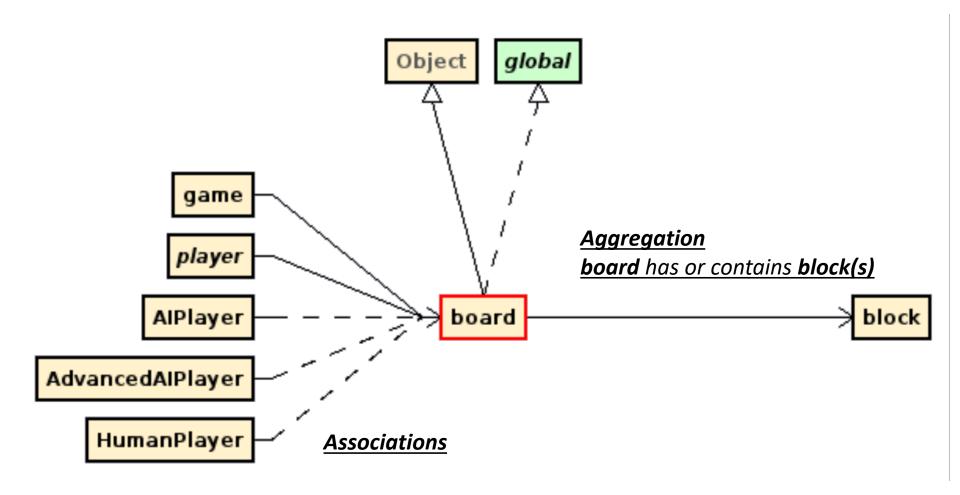

+ block( ) : void

Methods

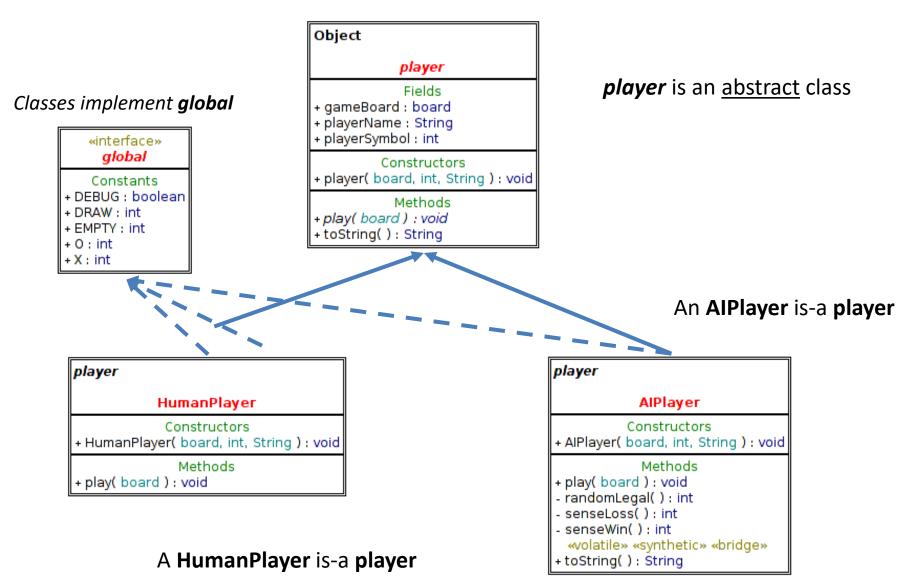

+ isValidState( int ) : boolean

+ toString(): String

## Association and Aggregation relations

## Sample UML used in the Demo

## Design Patterns

- How do you know which object does what?
- Design patterns in Object Oriented Design are common practices by software architects who define these named patterns in terms of problem-solution pairs.

#### Example:

Problem: Who creates "block" instances?

Solution: "board" because it contains or uses the blocks.

Design pattern name applied here: creator

This is why the board class instantiates block instances.

Can you tell what pattern I used to create extensible player types?

Here is a good reference:

https://www.cs.colorado.edu/~kena/classes/5448/f12/presentation-materials/rao.pdf

### main?

## You can try it...

- I provided the demo in a jar file
- A jar file is simply a java archive containing a bunch of files which make it easy for distribution.
- Follow the instructions given in the link in the assignment folder to run it.

Good luck!
